

DATA ANALYST PORTFOLIO

RavenStack Churn Analytics

Understanding why 22% of SaaS customers churn — and what the data reveals about industry, acquisition, and revenue patterns.

PERIOD

Jan 2023 – Dec 2024

ACCOUNTS

Executive Summary

Key metrics and top-line findings at a glance

500

Total Accounts

Jan 2023 – Dec 2024

110

Churned Accounts

Left during the period

22%

Overall Churn Rate

Above SaaS industry avg

\$2,426

Avg MRR (Churned)

Higher than active users

Key Findings

- DevTools industry had the highest churn rate at 30.97% — nearly 2× Cybersecurity (16%)
- Customers acquired via events churned at 30.21%; partner-acquired customers were most loyal at 14.61%
- Churned customers had higher average MRR (\$2,426 vs \$2,251) — price is not the driver
- Support quality and feature usage showed no meaningful difference between churned and active customers
- Trial users churned at 25.77% vs 21.09% for non-trial — onboarding gap likely

Churn Rate by Industry

DevTools stands out as a high-risk segment

High Risk

DevTools churn rate of 30.97% is nearly 2× the lowest segment (Cybersecurity at 16%).

Stable Segments

Cybersecurity and EdTech retain customers more effectively — below the 22% average.

SQL Query

```
GROUP BY industry · ORDER BY  
churn_rate DESC
```

Churn Rate by Referral Source

Acquisition channel strongly predicts retention

Strategic Implications

Scale Partner Channel

Lowest churn at 14.61%. Invest in co-marketing and referral programs.

Prioritize Organic SEO

17.54% churn — organic users are more intentional and higher-quality.

Review Event ROI

30.21% churn — event leads may be low-intent. Reevaluate spend.

The Revenue Paradox

Churned customers were paying more — not less

Active Customers

Avg MRR

\$2,251

Avg ARR

\$27,008

vs

Churned Customers

Avg MRR

\$2,426

Avg ARR

\$29,115

What this means:

Higher-paying customers are churning — likely because they have higher expectations the product isn't meeting. Price sensitivity is not the root cause. Product value delivery is.

Why Customers Churn

Feature gaps are the #1 driver — support issues dominate in DevTools

Overall

DevTools only

In DevTools, support and budget tie as top reasons — unlike the overall dataset where features dominate. Suggests a documentation / self-serve gap.

Additional Findings

Plan tier, trial status, support quality, and feature usage

Churn by Plan Tier

Enterprise	22.08%	≈
Basic	22.02%	≈
Pro	21.91%	≈

No significant difference across tiers

Trial vs Non-Trial

Trial users churn 22% more than paid from day one

Support Quality vs Churn

Metric	Active	Churned
Avg Satisfaction	3.97	4.01
Resolution (hrs)	35.92	35.66
First Response (min)	89.5	84.78

Churned customers received slightly better support — ruling out service quality as a churn driver.

Recommendations

Actionable steps based on the data

01 Investigate DevTools Churn

Conduct qualitative interviews with churned DevTools customers. With 30.97% churn and no single dominant reason, a product-market fit issue is likely.

02 Shift Budget to Partner Channel

Partner-acquired customers churn at 14.61% vs 30.21% for event leads. Reallocating even 20% of event budget to partner programs could significantly reduce overall churn.

03 Improve Trial Onboarding

Trial users churn 4.68 points higher than non-trial. A structured onboarding flow — guided setup, early value moments, check-in emails — can close this gap.

04 Protect High-MRR Accounts

Churned customers paid \$175 more/month on average. Proactive success management for accounts above \$2,000 MRR should be prioritized to protect ARR.

Thank you
